

Applying quotas to front-of-row counters

Overview

The rate-limit-by-key and quota-by-key policies provide a more flexible solution to traffic control. These policies allow you to define expressions to identify the keys that are used to track traffic usage. The way this works is easiest illustrated with an example. Being able to throttle incoming requests is a key role of Azure API Management. Either by controlling the rate of requests or the total requests/data transferred, API Management allows API providers to protect their APIs from abuse and create value for different API product tiers. Rate limits are usually used to protect against short and intense volume bursts. For example, if you know your backend service has a bottleneck at its database with a high call volume, you could set a rate-limit-by-key policy to not allow high call volume by using this setting. Caution Due to the distributed nature of throttling architecture, rate limiting is never completely accurate. The difference between the configured and the actual number of allowed requests varies based on request volume and rate, backend latency, and other factors. Quotas are usually used for controlling call rates over a longer period of time. For example, they can set the total number of calls that a particular subscriber can make within a given month. For monetizing your API, quotas can also be set differently for tier-based subscriptions. For example, a Basic tier subscription might be able to make no more than 10,000 calls a month but a Premium tier could go up to 100,000,000 calls each month. Within Azure API Management, rate limits are typically propagated faster across the nodes to protect against spikes. In contrast, usage quota information is used over a longer term and hence rate throttling capabilities that are scoped to a particular subscription are useful for the API provider to apply limits on the developers who have signed up to use their API. However, it does not help, for example, in throttling individual end users of the API. It is possible for a single user of the developer's application to consume the entire. The following policies restrict a single client IP address to only 10 calls every...
