

Does a fiber optic splitter need to be used for broadband over long distances

Overview

Yes, with the optical splitter, various end users can access broadband networks through the same fiber. This point-to-multipoint architecture helps reduce space occupation and effectively save optical cable resources, achieving efficient network expansion at a lower cost. What is. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. 1x32 splits were common in North America for G-PON architectures. Beyond. According to the Broadband Forum, PLC splitters are essential for achieving scalable and cost-effective GPON and XGS-PON deployment in access networks.
