

Does the optical module require bidirectional transmission

Overview

In typical MMF modules, 8 fibers are required to achieve bi-directional communication (4 Tx and 4 Rx). This is why the industry often pushes 8-fiber or 12-fiber MPO connectors for high-speed links. BiDi transceiver, a compact optical transceiver with WDM (wavelength division multiplexing) technology and SFP multi-source protocol (MSA) compliance, allows fast data transmission using a single fiber optic for both sending and receiving signals, saving resources and cutting infrastructure costs. Extends data transmission over long distances, from a few meters (MMF) to over 100 kilometers (SMF), depending on module type. Allows modules to be inserted or. BiDi optical modules, also known as bidirectional optical modules, usually consist of two different wavelengths and can achieve transmission in two directions on one optical fiber (single-mode or multi-mode). Simple design and low requirements.
