

How many kilometers of optical fiber cable are needed for optical modules

Overview

A: For most applications, the maximum distance of a single-mode cable is around 160 kilometers. Q: How far can multimode fiber go?

A: It varies with the data speed and fiber type. Take the. For example, a fiber optic cable with a distance of 1km supports a bandwidth of 500MHz, while a fiber optic cable with a distance of 2km can only support a bandwidth of 250MHz. There are three main reasons for this: First, high-bandwidth signals are more susceptible to chromatic dispersion than. Fiber optic cable can be run anywhere from 300 meters up to 80 kilometers (roughly 50 miles) depending on the cable type, transceiver used, and network standard. Single mode fiber can transmit light signals over 100+ kilometers without amplification. For an OS2 cable with an attenuation of 0,35 dB/km at 1310 nm, 4 connectors ($4 \times 0,5 \text{ dB} = 2 \text{ dB}$) and 2 splices ($2 \times 0,1 \text{ dB} = 0,2 \text{ dB}$):
 $\text{max distance} \approx (14 - 2 - 0,2) / 0,35 \approx 33 \text{ km}.$
