

# IQ Transimpedance Amplifier

## Overview

In electronics, a transimpedance amplifier (TIA) is a current to voltage converter, almost exclusively implemented with one or more operational amplifiers (opamps). The TIA can be used to amplify the current output of Geiger-Müller tubes, photo multiplier tubes, accelerometers, photodetectors and other sensors (that are modeled well as a current source) into a usable voltage. Current to vo. DC operationIn the circuit shown in Figure 1, a sensor (represented as a current source) such as a photodiode is connected between ground and the inverting input of the opamp. The other input of the opamp is also connected to ground. The frequency response of a transimpedance amplifier is inversely proportional to the gain set by the feedback resistor. The sensors which transimpedance amplifiers are used with usually hav. A TIA's voltage noise consists of (a.k.a.  $1/f$  noise), which dominates at lower frequencies, and (a.k.a. thermal noise), which dominates at higher frequencies.

What you need to know about transimpedance amplifiers part 1

TIAs are conceptually simple: a feedback resistor ( $R_F$ ) across an operational amplifier (op amp) converts the current ( $I$ ) to a voltage ( $V_{OUT}$ ) using Ohm's law,  $V_{OUT} = I \times R_F$ . In this series of blog posts, I will
