

Inspection of residual current device RCD in secondary distribution box

Overview

In order to comply with the wiring standards, the residual device that provides additional protection should disconnect within thirty milliseconds (30 ms) if it is tested at five times the typical current that it needs. Note that the term 'live' refers to a residual current monitor. The residual magnetic field induces a voltage in the core of the summation current transformer, which can then be detected by evaluation electronics and interpreted as the result of a residual current connected by a connection cable. What is an RCD?

How are RCDs tested?

What happens during RCD Testing?

Why Residual Current Device Testing carried out?

How frequently must RCD testing occur?

This quarterly inspection checklist is designed to help facilities teams verify the operation of residual current devices across distribution boards and individual circuits. During an Electrical Installation Condition Report (EICR), we thoroughly test RCDs to ensure they function correctly. This process guarantees compliance with BS 7671 (18th.
