

Monaco-type relay protection tester

Overview

Compact test system specially designed for testing all types of digital and static protection relays. Therefore, they must work reliably at all times. Only correctly operating protection relays protect your primary equipment from damage and contribute to a reliable power grid. This is why protection relays must undergo thorough tests. Power System protection is crucial part of power station and substations safety which use protection relays and circuit breakers to isolate faulty parts or zones within the plant including Generator zone, Motor zone, Feeder zone, Bus zone, Transformer zone and Transmission Lines zone. This guide explores the different types of protection relays and their testing procedures. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards.
