

Panama NRZ Optical Transceiver Module

Overview

These reliable and robust QSFP28 modules support high speed bit rates up to 50Gb/s over link distances up to 40km and can be offered with a choice of 1-lane 50G PAM4 or 2-lane 25G NRZ electrical interfaces. networks and other communication environments. PAM4 vs NRZ, are the two most commonly used modulation technologies, each with its own advantages and applications. This article will delve into the differences between these two technologies, and their respective application scenarios, and guide how to choose the most suitable 50G optical module. Non-return-to-Zero is a simple binary modulation scheme that represents data using two voltage levels, a logical “1” represented by a high voltage level, logical “0” by a low. The focus is on physical layer standards, transceiver form factors (SFP, QSFP, CFP families), and practical considerations for deploying these technologies in data centers. NRZ is a simple way to send signals. This method uses two voltages to show binary data. With options for a 4-channel configuration (4TX+4RX) or 12-channel half duplex (12TX or 12RX), this high-speed fiber optic module accommodates data.
