

# Power Fiber Optic Cable Identification Technology

## Overview

They use a non-destructive macro-bend method to detect the presence of signals in fiber across a wide range of wavelengths (900-1700nm or wider) without disrupting service. They detect CW traffic signals and modulated tones at frequencies like 270Hz, 1kHz, and 2kHz. The OFI-BIPM/-BIPMe optical fiber identifier is an easy-to-use tool that determines if a fiber is live, the transmission direction, and the relative core power on standard and bend-insensitive single-mode and multimode fibers. Its positive-stop trigger mechanism provides the right amount of. The type of power fiber optic cable fault event obtained by analyzing the optical time domain reflectometer (OTDR) detection curve is an important basis for ensuring the operation quality of communication lines. The optical cable identifier is the first intelligent high-precision testing instrument equipped with multiple functions such as cloud wireless transmission and smart optical cloud platform. It adopts an 8-inch capacitive full touch screen supporting multi-point touch, Integrated optical cable.
