

Return Loss of Multimode Fiber Optic Connectors

Overview

Return loss, also known as reflection loss or back reflection, is the measurement of the amount of light reflected back towards the source when it encounters a fiber optic connector. It is also called. Beginning with software release 1. Optical return loss for individual events, i. Optical return loss is given in units of dB and always a. MPO (Multi-Fiber Push-On) connectors are high-density fiber optic connectors designed to carry multiple fibers—typically 12 or more—within a single interface. It is caused by factors such as misalignment, air gaps, and imperfections in the connector components. The lower the insertion loss, the better the performance of. This Applications Engineering Note (AEN 135) explains and recommends standard measurement methods for characterizing optical fiber system performance. Fiber optic connectors are of particular importance, as they show significant quality differences which cannot be seen by the eye.
