

Single-mode fiber optic transmission of duplex signals

Overview

Singlemode cable features a 9-micron glass core. Duplex cable consists of two fibers, usually in a zipcord (side-by-side) style. In this video, we bust a common myth in fiber optics and reveal the truth about how duplex signal transmission works in both single-mode and multimode fiber. Learn about wavelength division duplexing (WDD), the science behind simultaneous send/receive data, and how this applies. more In this. Simplex single-mode fiber is typically used in scenarios where data only needs to be sent in one direction, such as in sensor application like a fire alarm system that sends signals from detectors to a control panel might use simplex fiber. That makes picking between single mode and multimode fiber optic cables an. In fiber optic cables, data is transmitted as pulses of light that travel along a thin strand of glass or plastic fiber.
