

The function of the dust cover on the pigtail box

Overview

The Double Seal effect results from a molded-in circular ring in the connector, which corresponds to a mating ring on the lamp. The inner sealing ring covers the terminal area and the outer ring, or dust skirt, seals around the outside area of the lamp plug connection. The fiber optic distribution box is a widely used product in FTTH and FTTB. Its main function is to safeguard the connection point of the optical cable to the user end, ensuring that the access point of the optical cable remains stable, dust-proof, and waterproof. FDBs play a pivotal role in maintaining signal integrity over long distances, offering a centralized location for splicing. ST Fiber Optic Pigtail: The most common connector for multimode fiber optic LAN applications is the ST pigtail connector. It has a ferrule with an extended 2.5mm diameter composed of ceramic (zirconia), stainless alloy, or plastic. As a result, SC fiber pigtails are commonly used in. CAUTION: The wearing of cut-resistant safety gloves to protect your hands from accidental injury when using sharp-bladed tools and armored cable is strongly recommended. To minimize the chance of injury.
