

The secondary power distribution box on the construction site needs to be grounded

Overview

The system is considered effectively grounded if COG is less than or equal to 80%.

Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel.

Equipment Protection: Grounding protects substation. The secondary spot network bus is concurrently fed by two or more primary feeders via network transformers. Nearly all spot networks in North America function at a 480Y/277-V secondary voltage. High service. A construction power distribution box is an essential part of a construction site as it ensures that the power needs of all the equipment and machinery on the site are met. It is a 4-wire system and the LV neutral is multiple grounded at all cable terminations, at MV / LV substations, distribution pillars, and consumer locations. All accessible metal work of all distribution equipment is always. OSHA's grounding requirements are spelled out primarily in two sets of regulations: 29 CFR 1910 Subpart S for general industry workplaces, and 29 CFR 1926 Subpart K for construction sites.
