

Upgraded version of off-grid power supply system for backbone network use

Overview

This paper proposes an off-grid power supply system comprised of a reversible solid oxide fuel cell (RESOC), photovoltaic (PV) and battery. Minimum operating costs and the reliability of system operations under constraint conditions are the key determining objectives. for the duration of the expected downtime. An Energy Storage System powers the base load with solar during the day and stores excess solar energy to power through the evening and night enabling self-consumption, the grid assists in powering peak consumers or on grey days. An off-grid system powers. Off-grid power systems, which generate electricity independently of the central grid, offer a viable power generation system alternative especially in places where extending the main grid is economically impractical or environmentally unsustainable. Each SPS consists of a renewable energy supply such as solar panels, battery energy storage system and a backup generator, making them completely self-sufficient power units.
