

What is a fiber optic communication USB

Overview

Optical USB is a universal serial bus technology that uses fiber optics to increase data transmission speeds. Although some believe optical technology is part of the USB 3.0 standard, the two are different. By integrating optical fibers into the cable design, Active Fiber Optic USB Cables achieve unprecedented levels of data transmission speed and distance, significantly. Fiber-optic communication is a form of optical communication for transmitting information from one place to another by sending pulses of infrared or visible light through an optical fiber. Fiber is preferred. USB over fiber extenders (also called adapters, converters, and transceivers) allow for transmitting USB data at a greater distance and speed than is supported by USB cables. They're thin, light, and remarkably tough — Optical Cables by Corning can be bent, squeezed, and tangled. Available in 10m, 15m, 30m, and 50m lengths.

Fiber-optic communication

OverviewParametersBackgroundApplicationsHistoryTechnologyComparison with electrical transmissionGoverning standards

Because the effect of dispersion increases with the length of the fiber, a fiber transmission system is often characterized by its bandwidth-distance product, usually expressed in units of MHz·km. This value is a product of bandwidth and distance because there is a trade-off between the bandwidth of the signal and the distance over which it can be carried. For example, a common multi-mode fiber with a bandwidth-distance product of 500 MHz·km could carry a 500 MHz signal for 1 km or a 1000 MHz sig
