

What is a low-voltage copper busbar

Overview

A low voltage busbar is a conductive material, typically made of copper or aluminum, that connects multiple electrical components together—in simple terms, it's like a highway for electricity. Low voltage busbars are used in systems where the voltage level is below 1000 volts. This standard defines the design verification, test requirements, and thermal performance of the assemblies. Behind every reliable low voltage switchgear lineup is a design balance that is harder than it first appears: current must flow safely, heat must be controlled, internal space. Busbars are the main current-carrying conductors inside a low voltage switchboard, and they strongly influence thermal performance, fault withstand, maintenance safety, and panel footprint. These busbars serve. A busbar trunking unit permitting axial movement of the busbar conductors due to the differing coefficients of expansion of differing materials.
