

What is a telecommunications ribbon optical cable

Overview

A ribbon fiber optic cable is a specialized type of cable where multiple optical fibers (typically ranging from 4 to 24, with 12 being the most common) are laid out in a parallel, flat array. These fibers are bonded together with a matrix material, forming a thin, ribbon-like structure. They are a fundamental piece of equipment in a telecoms network – powering communication and internet access by enabling high-speed data. The technology of ribbon fiber optic cables is well-established in the telecommunications industry and is favored for its high fiber density and compact size. While traditional fiber optic cables contain individual fibers encased in a protective jacket, ribbon fiber cables organize fiber optic. Ribbon optical cable is a type of cable widely deployed in campus, building and data center backbone applications where high fiber counts are required. At present the 12-fiber ribbons are readily. Ribbon cables offer higher fiber counts and greater fiber density than any other cable construction designed for the outside plant (OSP), four times the highest-fiber-count loose tube cable.
