

What type of panel should be used for pre-installed fiber optic cables

Overview

Fiber optic patch panels are enclosures that act as a distribution hub for fiber cable. A bulk (multi-strand) fiber cable enters the patch panel and then each fiber strand is separated into individual strands or pairs of strands. While patch panels may look similar at first glance, differences in structure, capacity, connector type, and application can significantly impact installation efficiency, maintenance. Patch panels help making the connection of different devices easy and organized, such as computer stations, servers, switches, electric or electronic instruments. This is shown in the picture below. Network architects and procurement managers must now evaluate patch panels not merely. A fibre patch panel is a fundamental component of any structured fibre optic network, providing a central point for managing, organising, and distributing fibre connections.
