

Why does a 100g optical module have four light receivers

Overview

The 100G PSM4 uses 8 parallel fibers (4 send and 4 receivers), each sending 25Gbps (Figure 2). 100G Single Lambda (1x100G): Uses one high-speed laser operating at 100 Gbps on a single wavelength (e., 1310nm for LR1, or a specific DWDM/CWDM channel). Think of it as a single, powerful highway lane. It provides low-cost solutions for long distance data center optical. QSFP28 is the main form factor for 100G optical modules. What are the 100G optical module standards and how should we choose?

Today, we will briefly sort out the 100G optical module standards and packaging. 100G QSFP28 LR4 optical module: 100g QSFP28 LR4 optical module is generally used with LC single-mode patch cord, and the maximum transmission distance can reach 10KM. 100GBASE-LR4 QSFP28 optical module converts four 25Gbps electrical signals into four LAN WDM optical signals, and then multiplexes.
